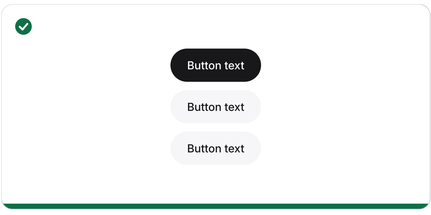
Button

Buttons are clickable elements that are used to trigger actions. They communicate calls to action to the user and allow users to interact with pages in a variety of ways. Button labels express what action will occur when the user interacts with it.

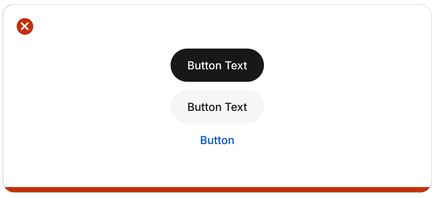
Button Groups / Stacking / Fluid Buttons

Choosing the right button variant in a button group

Due to the visual weight of the secondary button, it's recommended to use tertiary or ghost buttons in layouts with more than three calls to action

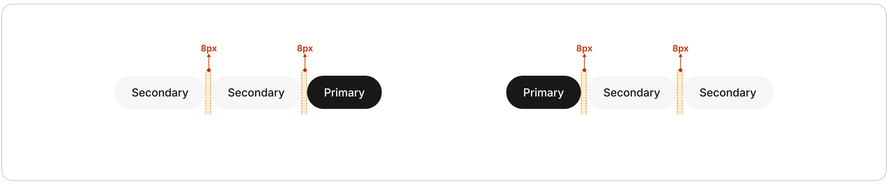


Select a primary and one other button variant. Do not mix multiple variants.



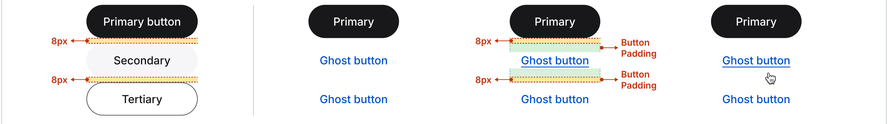
Do not mix primary, secondary, and tertiary buttons in the same group.

Horizontal button groups

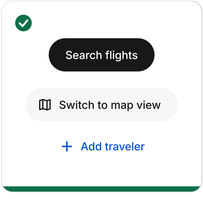


Vertical button groups

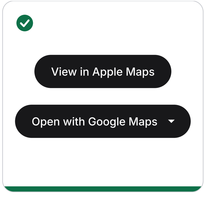
While stacking buttons vertically, keep the primary button on the top.



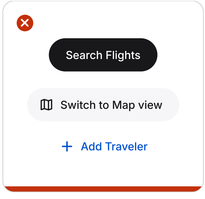
Text Label Guidelines



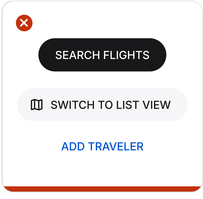
Use sentence case for CTA text



It is okay to capitalise the first letter of proper nouns



Do not use title case or capitalise a random word



Do not use all caps for CTA Text

Interactions and accessibility

- Icon-only butttons, which do not persistently display a text label, expose their label on hover and focus
- Buttons can be reached by using `Tab` and selected with `Space` or `Enter`
- Change the pointer cursor depending on the state of the button
- For Ghost buttons, only the label area is interactive. The bounding box that's visible on hover is non-interactive.
